

## **Abstract:**

This session aims at introducing the viewer to the concept of Event Driven Architecture implemented with a distributed and highly scalable message queue like Apache Kafka. We will start from the fundamentals, then move on to how they relate to Kafka and which are the major pitfalls and risks to avoid. Finally, before closing, we want to take a short glimpse on real world scenarios to give the viewer an idea on how to evaluate if this architecture is a good match for a use case."
